

ICD programming during VT ablation – The perils of not keeping it simple

Dewi Thomas

James Cook University Hospital,
Middlesbrough

www.heartrhythmcongress.org

Case Summary

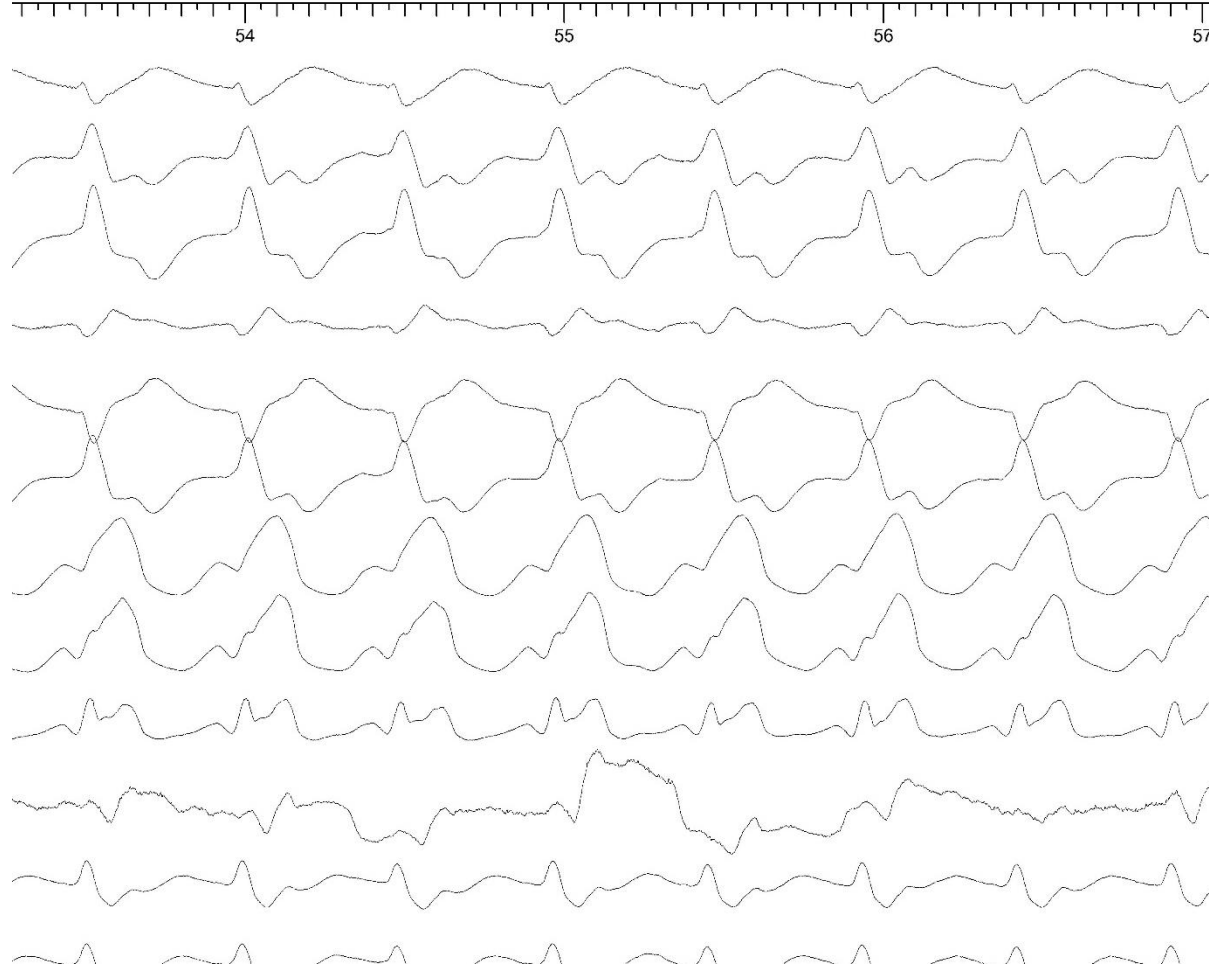

- 71 year man
- Ischaemic Cardiomyopathy – Chronically occluded LAD. EF<30%
- Boston Scientific Autogen EL DR-ICD implanted April 14
- Scheduled for VT ablation for due to recurrent shocks for monomorphic VT
- Marked sinus bradycardia and hypotension in lab, pacing mode programmed to DDDr with long AVD

AV sequential pacing during VT
→ V flutter and cardiac arrest

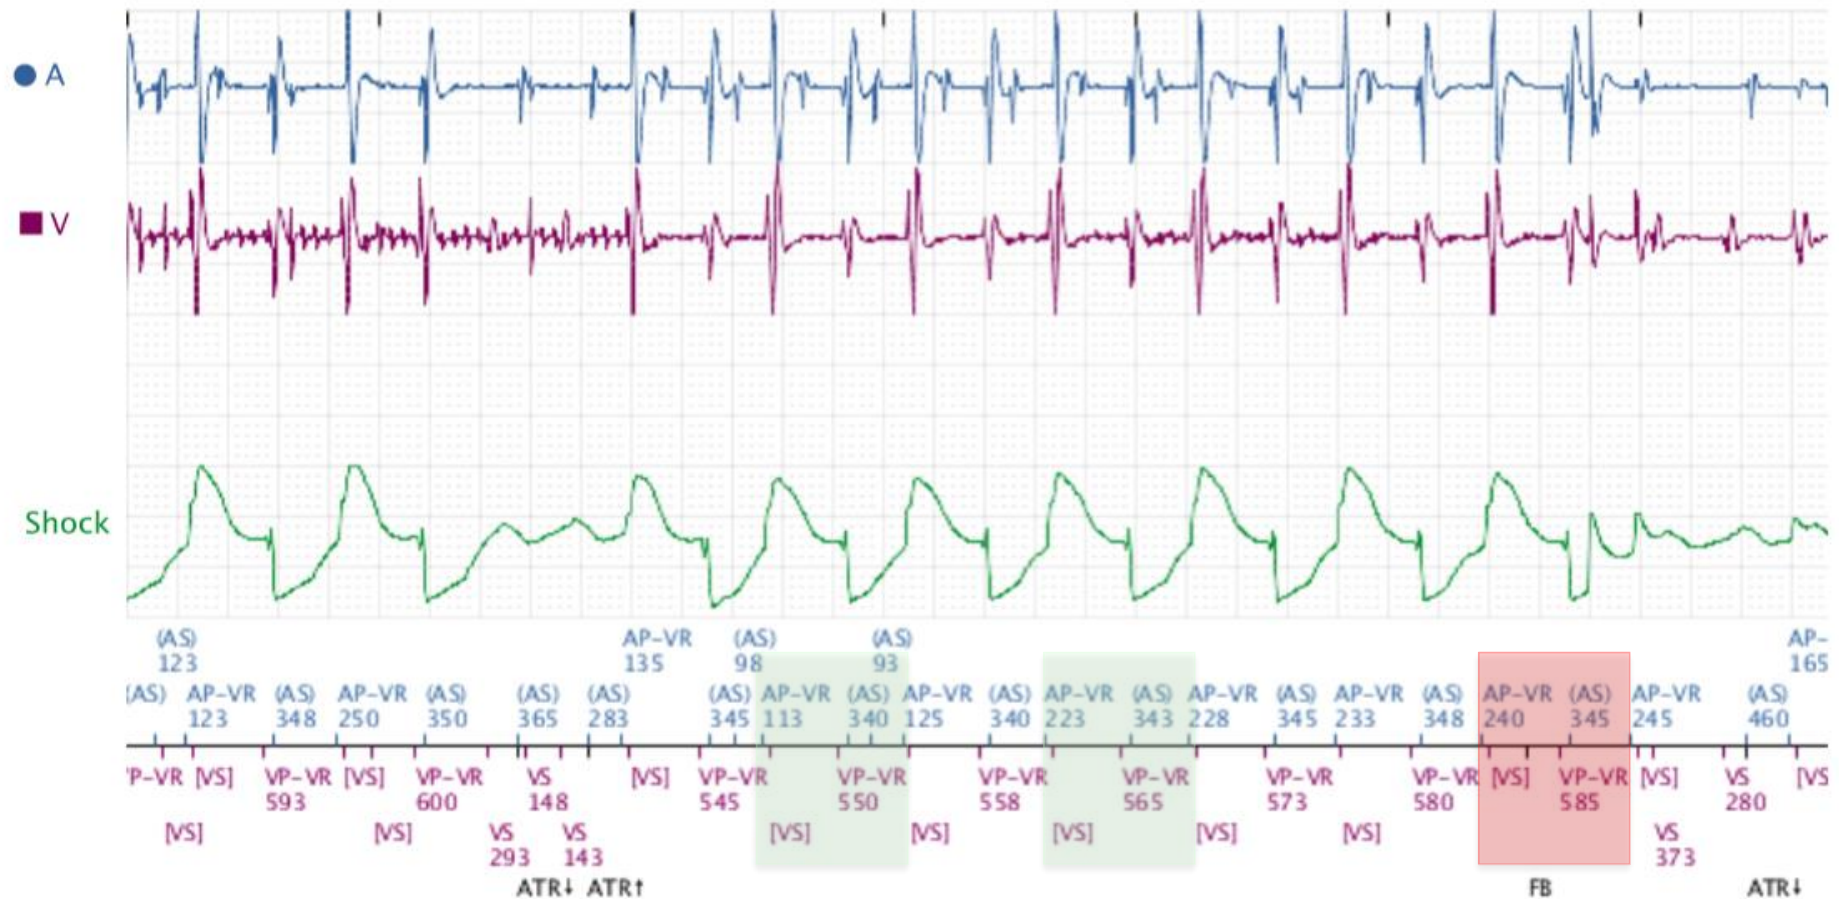

? cause

EGM displayed at 25mm per second

Conclusions and Learning Points

- Normal device function, but pro-arrhythmic programming
- Danger of long AV delays in dual chamber pacing
- Keep it simple - Stick with ventricular on demand pacing wherever possible during ablation procedures
