ARVC: Diagnostic challenges

Dr Shankar Sadagopan

Southampton University Hospitals

UK

Learning Objectives

A. Diagnosis using Revised Task Force Criteria

B. Diagnostic modalities outside Task Force Criteria

C. Quiz

D. Differential diagnosis

Introduction

- Genetics: Mutations in genes that encode constituents of intercalated discs of cardiomyocytes
- Histological hallmark: Cardiomyocyte loss and replacement of fibrous/ fibro-fatty tissues
- Characteristics: Arrhythmias, SCD & Progressive heart failure
- Prevalence: Estimated 1 in 5000 (M:F- 3:1)
- 10% of unexplained SCD in <69 yrs of age
- Median age of onset of symptoms: 29 yrs of age

Heart Rhythm Congress
www.heartrhythmcongress.org

Review article

Almanac 2014: cardiomyopathies

Oliver P. Guttmann [a], *Saidi A. Mohiddin* [b], *Perry M. Elliott* [a,*]

[a] *Inherited Cardiac Diseases Unit, The Heart Hospital, University College London, London, UK*
[b] *Department of Cardiology, The London Chest Hospital, London, UK*

Diagnosis using revised TFC

- Integration of data from
  1. Imaging techniques
  2. Depolarisation abnormalities on ECG
  3. Repolarisation abnormalities on ECG
  4. Arrhythmias
  5. Family history
  6. Tissue diagnosis

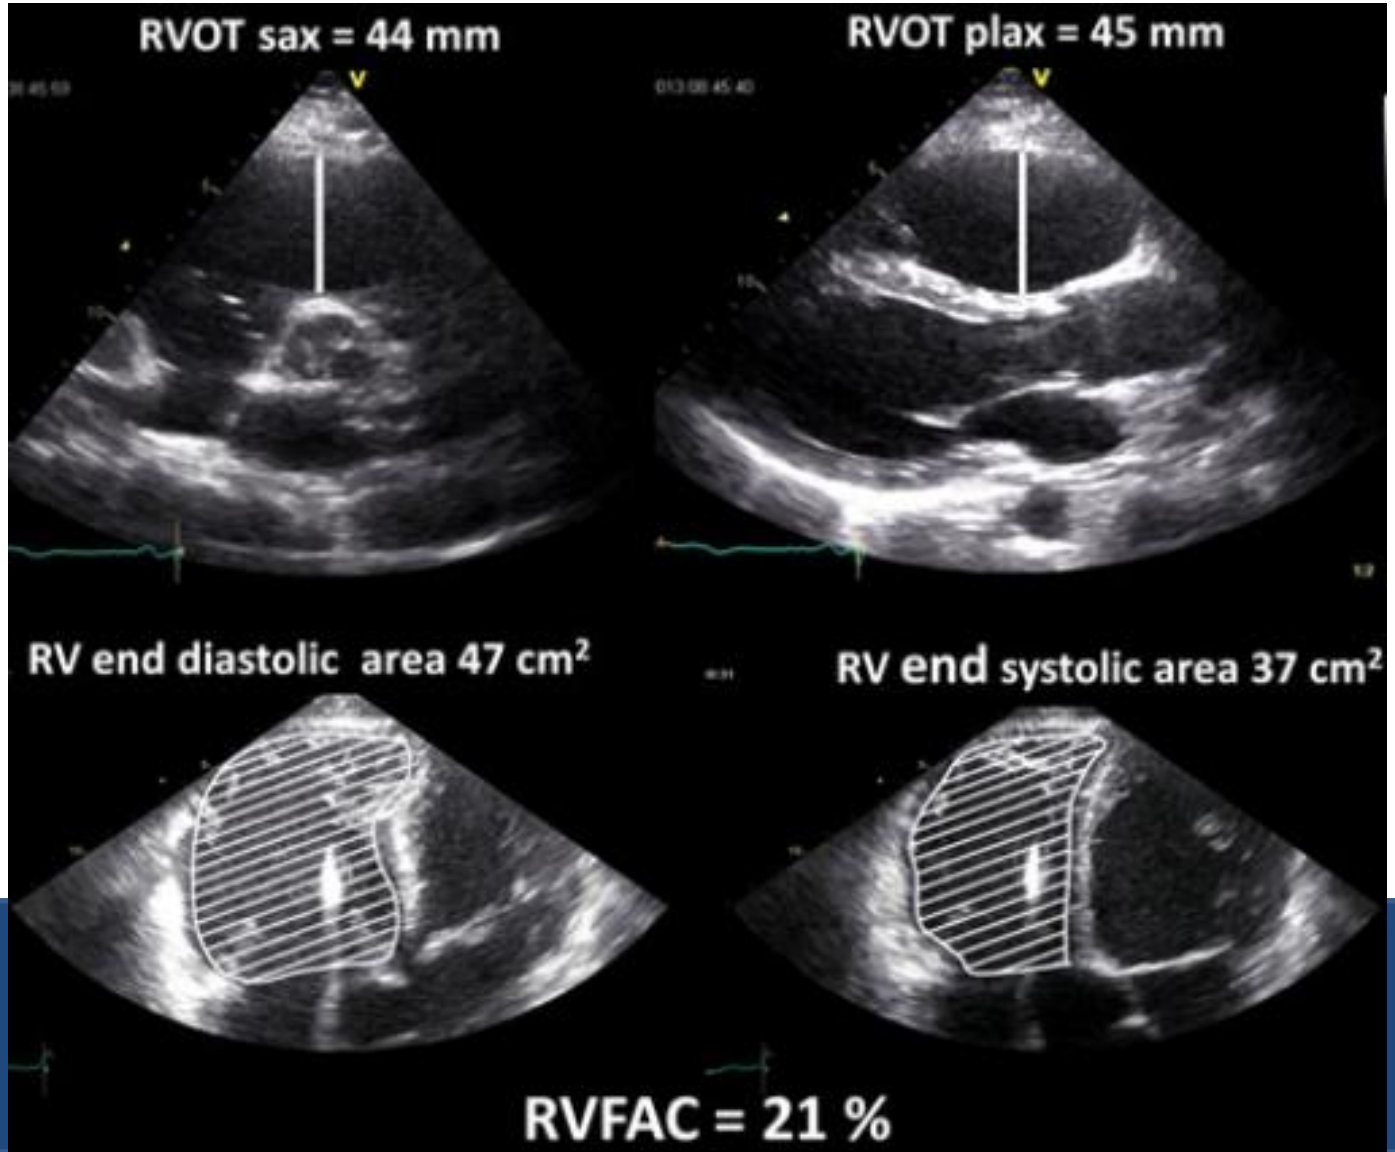
- Diagnostic groups

  – Possible: M(1) OR m(2)
  – Borderline: M(1)+m(1) OR m(3)
  – Definite: M(2) OR M(1)+m(2) OR m(4)

Imaging

Major Criteria	Minor Criteria
I. Imaging	
By 2D echo: Regional RV akinesia, dyskinesia, or aneurysm And 1 of the following (end diastole): PLAX RVOT ≥32 mm (corrected for body size [PLAX/BSA] ≥19 mm/m^2) PSAX RVOT ≥36 mm (corrected for body size [PSAX/BSA] ≥21 mm/m^2) Fractional area change ≤33%	By 2D echo: Regional RV akinesia or dyskinesia And 1 of the following (end diastole): PLAX RVOT ≥29 to <32 mm (corrected for body size [PLAX/BSA] ≥16 to <19 mm/m^2) PSAX RVOT ≥32 to <36 mm (corrected for body size [PSAX/BSA] ≥18 to <21 mm/m^2) Fractional area change >33% to ≤40%
By CMR: Regional RV akinesia or dyskinesia or dyssynchronous RV contraction And 1 of the following: Ratio of RV end-diastolic volume to BSA ≥110 ml/m^2 (male) or ≥100 ml/m^2 (female) RV ejection fraction ≤40%	By CMR: Regional RV akinesia or dyskinesia or dyssynchronous RV contraction And 1 of the following: Ratio of RV end-diastolic volume to BSA ≥100 to <110 ml/m^2 (male) or ≥90 to <100 ml/m^2 (female) RV ejection fraction >40% to ≤45%
By RV angiography: Regional RV akinesia, dyskinesia, or aneurysm	

Imaging by Echo



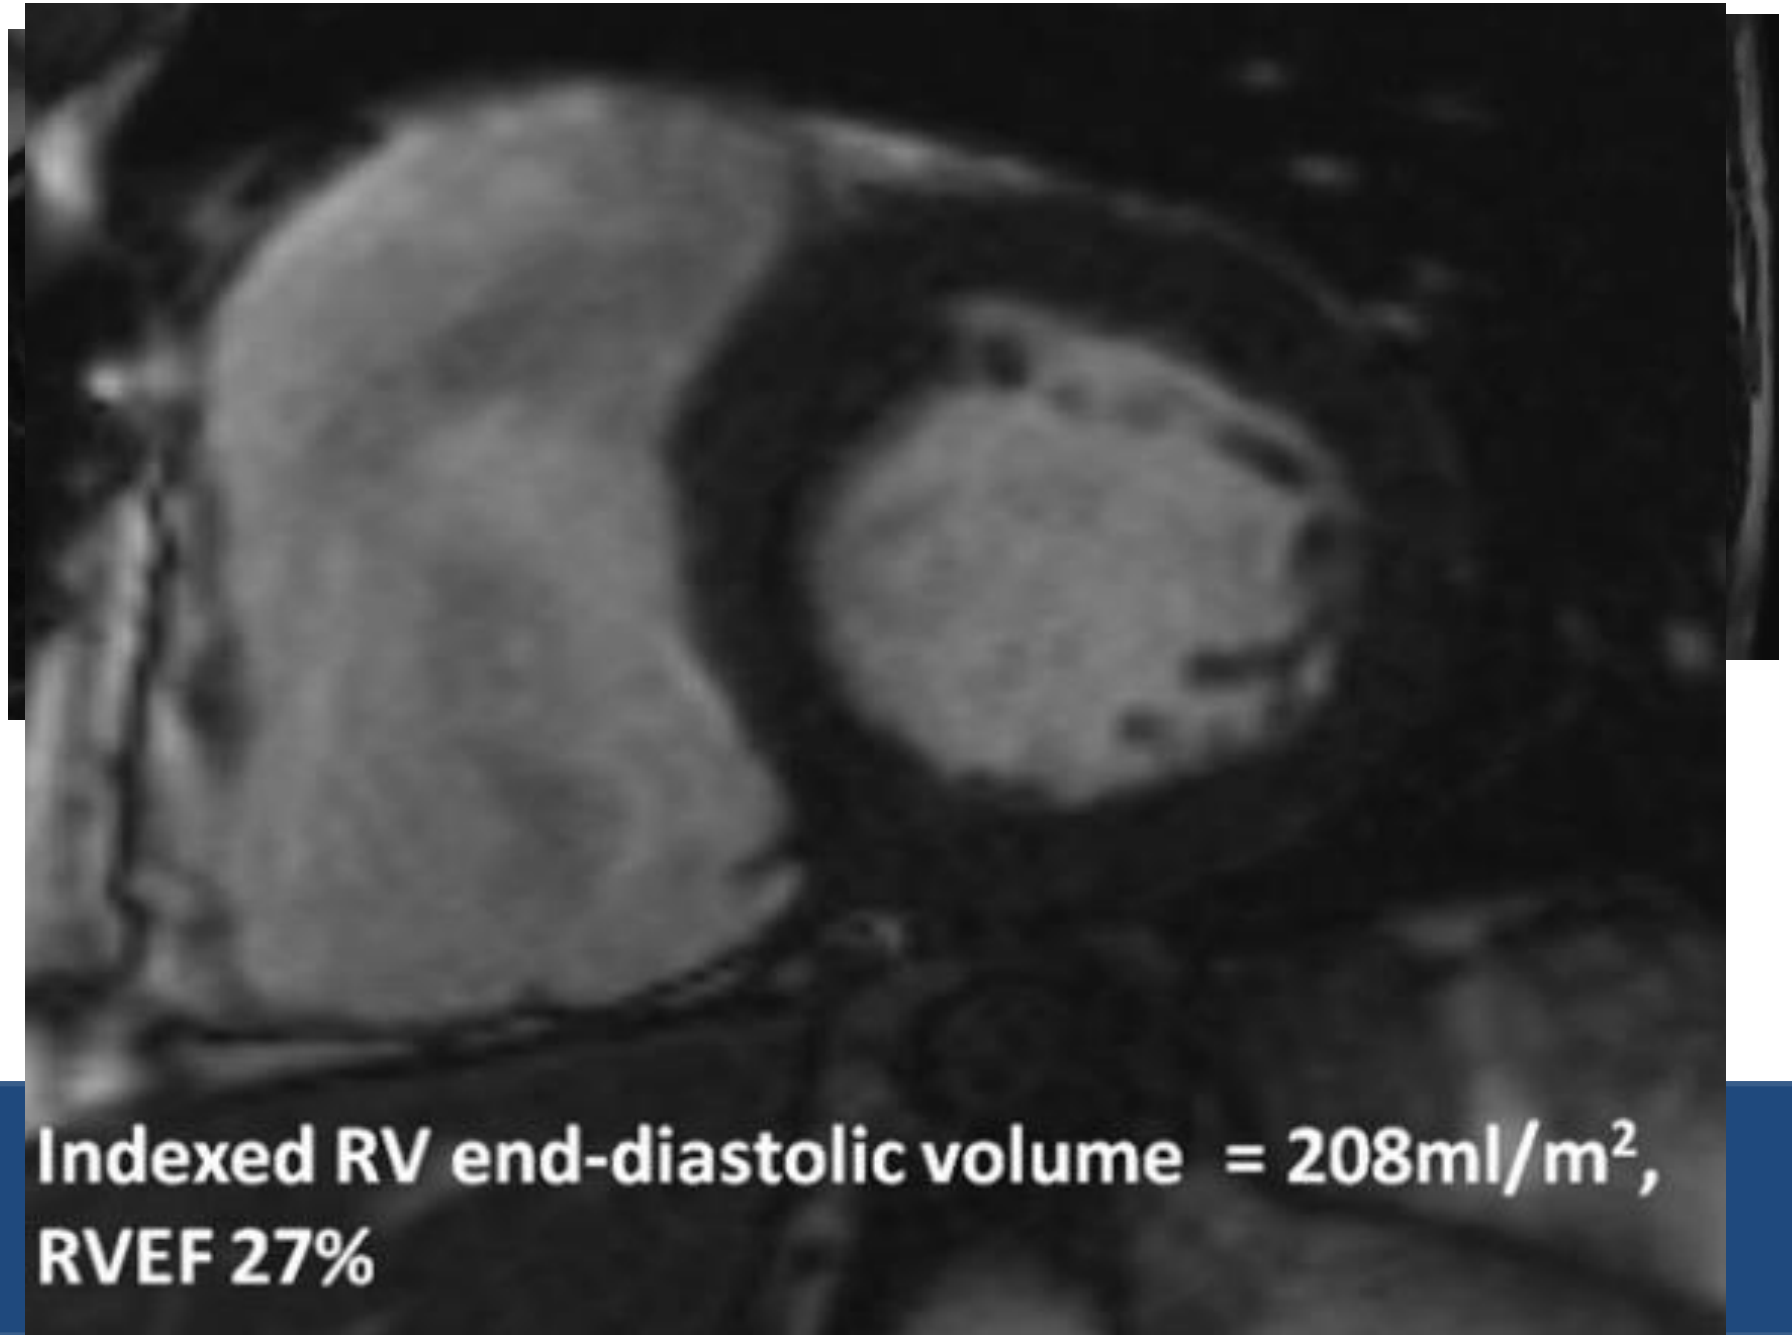
Imaging Criteria

	Value	Sensitivity, %	Specificity, %
Echocardiogram			
Major			
PLAX RVOT (diastole)	≥32 mm	75	95
Corrected for body size (PLAX/BSA)	≥19 mm/m²		
PSAX RVOT (diastole)	≥36 mm	62	95
Corrected for body size (PSAX/BSA)	≥21 mm/m²		
Fractional area change	≤33%	55	95
Minor			
PLAX RVOT (diastole)	≥29 mm	87	87
Corrected for body size (PLAX/BSA)	≥16 to ≤18 mm/m²*		
PSAX RVOT (diastole)	≥32 mm	80	80
Corrected for body size (PSAX/BSA)	≥18 to ≤20 mm/m²		
Fractional area change	≤40%	76	76
MRI†			
Major			
Ratio of RV end-diastolic volume to BSA			
Males	≥110 mL/m²		
Females	≥100 mL/m²	76	90♂
or		68	98♀
RV ejection fraction	≤40%		
Minor			
Ratio of RV end-diastolic volume to BSA			
Males	≥100 mL/m²		
Females	≥90 mL/m²	79	85♂
or		89	97♀
RV ejection fraction	≤45%		

Imaging by Angiography

Sensitivity and Specificity of Angiographic Findings in Adults with ARVC

Study	Angiographic Finding	Sensitivity (%)	Specificity
Daubert et al.[61]	Slow dye evacuation of RV		Low
	Deep fissuring in anterior wall		Low
	Localized akinetic or dyskinetic bulges	90	
	Wide, deep fissuring of apex or inferior wall	33	
Chiddo et al.[63]	Localized akinesia/dyskinesia	48	High
	Small conical outpouchings persisting in systole	40	
	Apical deep fissuring	8	
Conte et al.[64]	Aneurysmal formations of the right ventricle		100%
Daliento et al.[65]	Transversly arranged hypertrophic trabeculae separated by deep fissures	96	87.50%
	Posterior subtricispid and anterior infuldibular wall bulgings		
Peters et al.[66]	Segmental hypokinesia	72	
	Diffuse hypokinesia	28	
Hebert et al.[67]	RV ejection fraction < 35%	32	100%



Indexed RV end-diastolic volume = 208ml/m²,
RVEF 27%

Revised TFC in Children

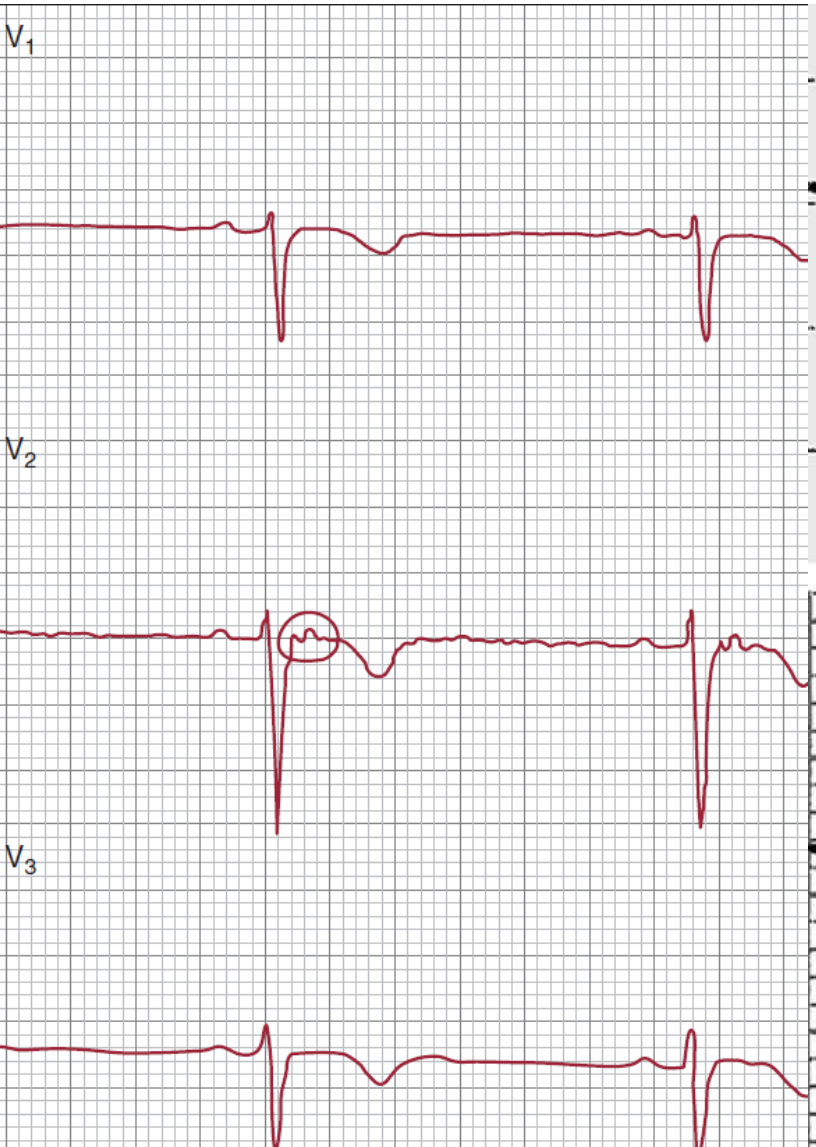
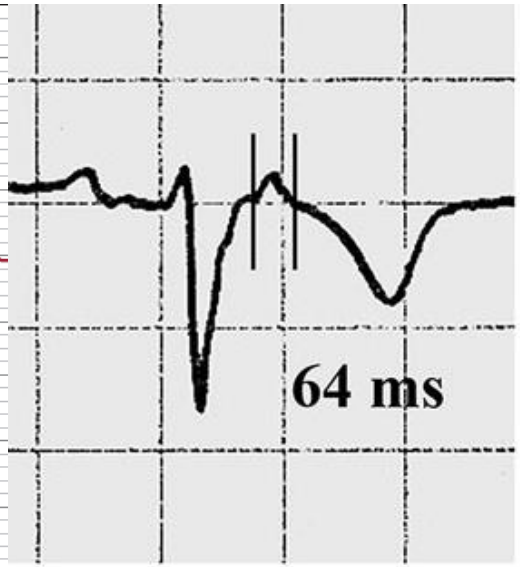
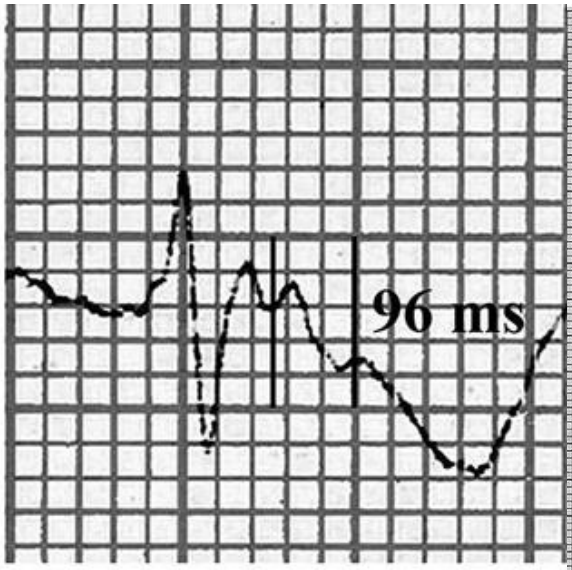
Depolarisation abnormalities

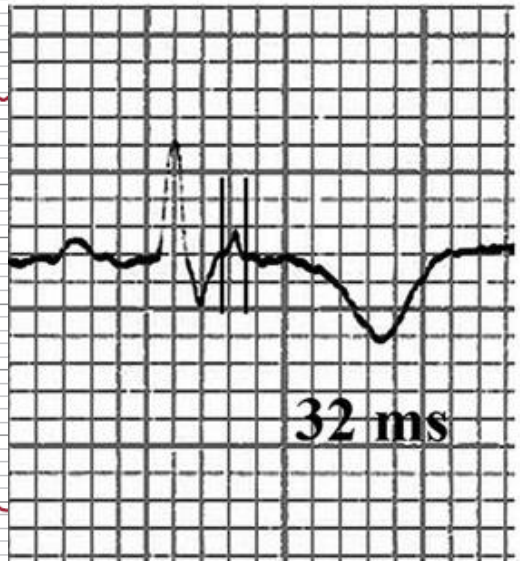
Major Criteria	Minor Criteria
IV. Depolarization/Conduction Abnormalities	
Epsilon wave (reproducible low-amplitude signals between end of QRS complex to onset of the T-wave) in the right precordial leads (V_1 to V_3)	Late potentials by SAECG in ≥1 of 3 parameters in the absence of a QRS duration of ≥110 ms on the standard ECG Filtered QRS duration (fQRS) ≥114 ms Duration of terminal QRS <40 μV (low-amplitude signal duration) ≥38 ms Root mean square voltage of terminal 40 ms ≤20 μV Terminal activation duration of QRS ≥55 ms measured from the nadir of the S-wave to the end of the QRS, including R′, in V_1, V_2, or V_3, in the absence of complete right bundle-branch block

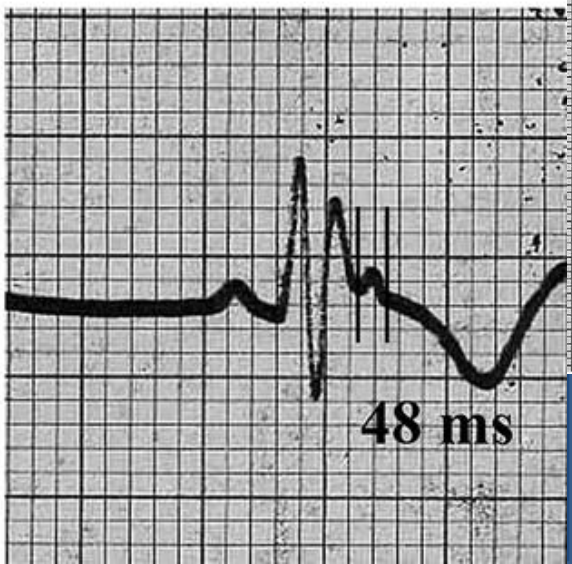
Depolarisation changes: Epsilon



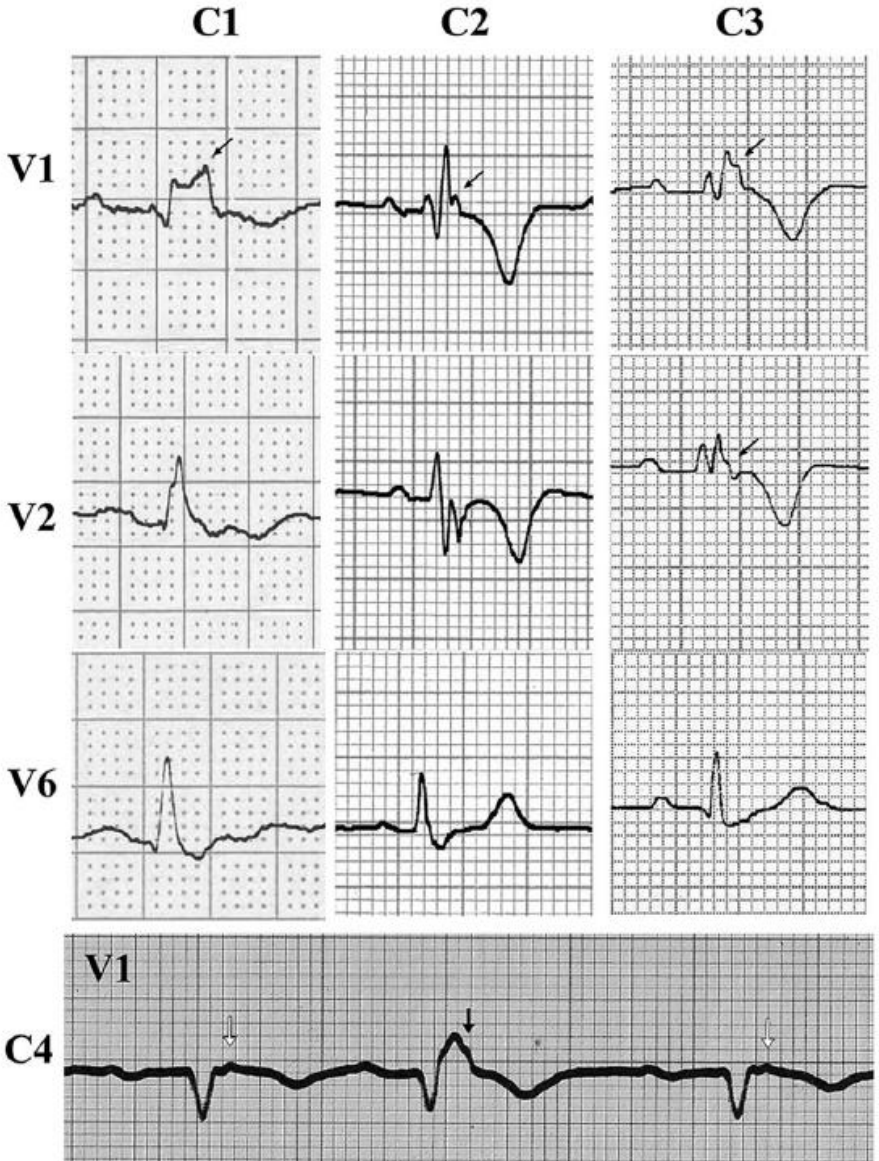








Depolarisation changes & Epsilon



Depolarisation changes: SAECG

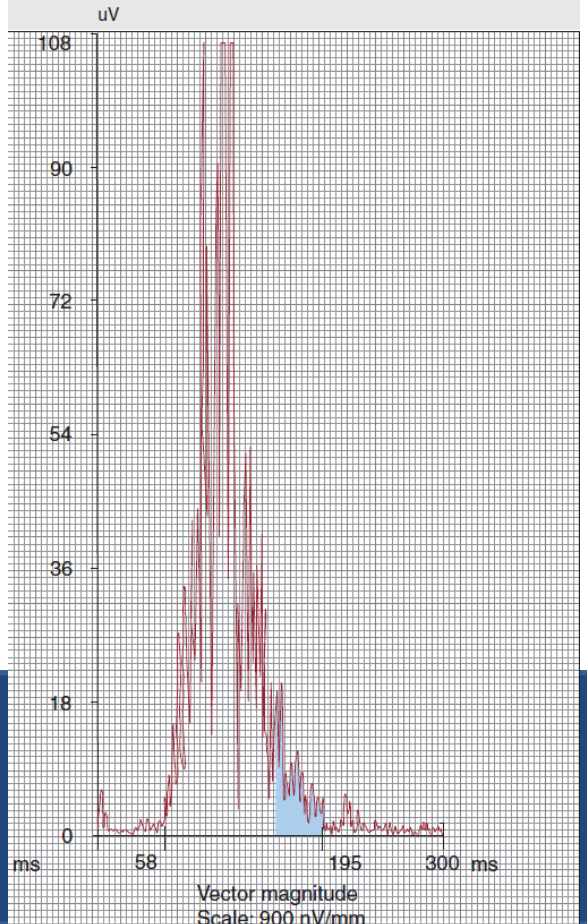
- Late Potentials> 1 of 3 features

1. Filtered QRS duration
   fQRS **≥114 ms**

2. Low Amplitude Signal duration
   (duration of terminal QRS), 40 mV:
   LAS40 **≥ 38 ms**

3. Root-mean-square voltage of
   terminal 40 ms:
   RMS40**≤20 mV**

		X	Y	Z	Vector
QRSD	(ms)	137.00	117.50	122.50	137.00
QRS	(μV)	26.37	28.11	27.79	45.44
QRS 40	(μV)	3.10	7.66	5.77	5.41
LAS	(ms)	77.50	58.00	64.50	77.00



Heart Rhythm Congress
www.heartrhythmcongress.org

SAECG: Serial testing

	Unfiltered QRS (ms)	QRS25 (ms)	LAS25 (ms)	RMS25 (μV)	QRS40 (ms)	LAS40 (ms)	RMS40 (μV)	QRS80 (ms)	LAS80 (ms)	RMS80 (μV)
Patient 1: First control	134	142	24	28	137	60	17	131	67	7
↓ 10 months	131	163	53	8	154	74	6	130	60	8

Signal-Averaged Electrocardiographic Parameter Progression as a Marker of Increased Electrical Instability in Two Cases with an Overt Form of Arrhythmogenic Right Ventricular Cardiomyopathy

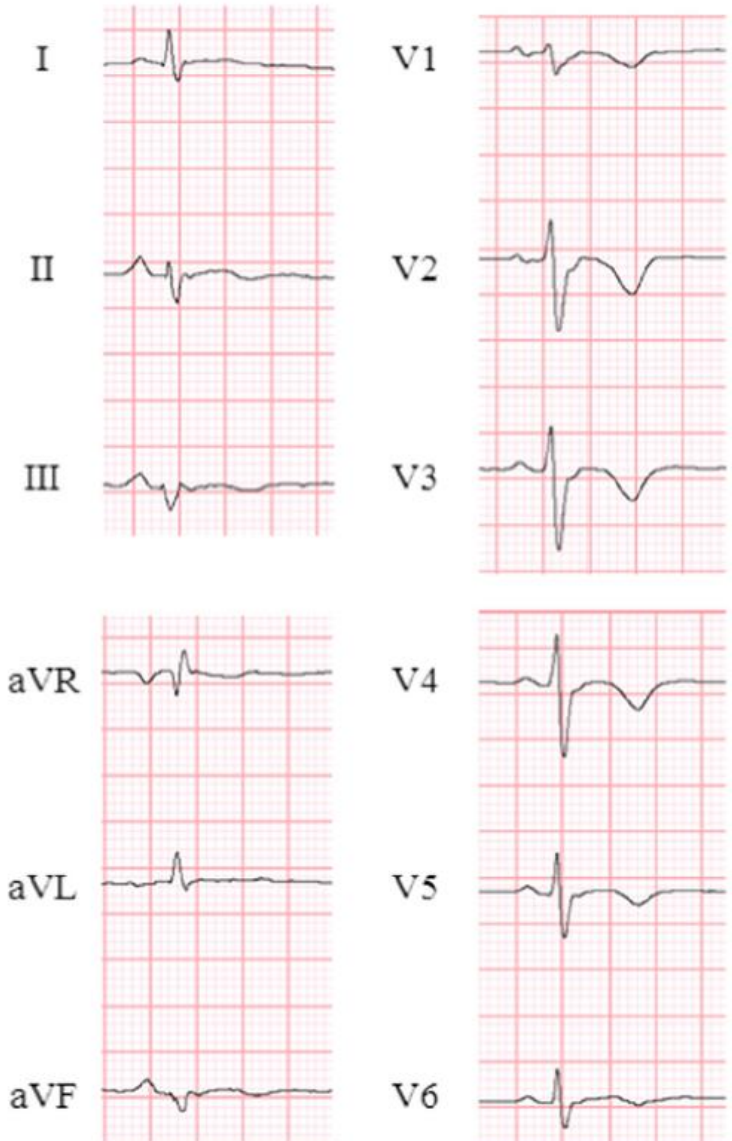
Depolarisation changes: TAD

Circulation. 2010

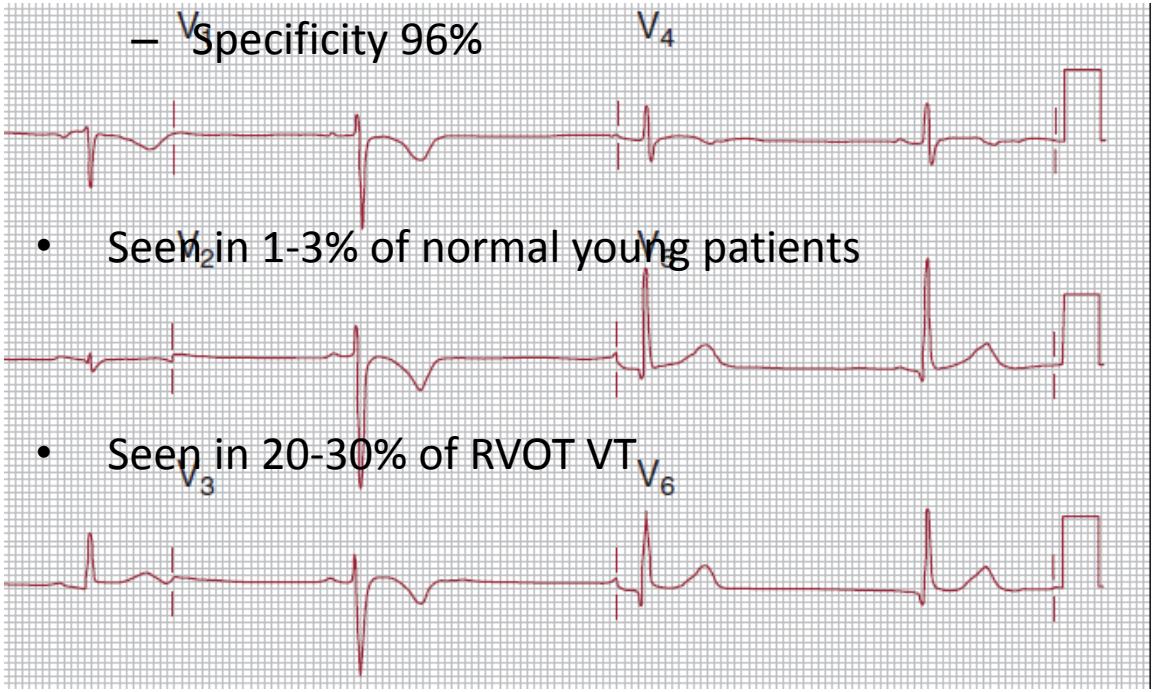
Repolarisation changes

Major Criteria	Minor Criteria
III. Repolarization Abnormalities	
Inverted T waves in right precordial leads (V_1, V_2, and V_3) or beyond in individuals >14 years of age (in the absence of complete right bundle-branch block QRS ≥120 ms)	Inverted T waves in leads V_1 and V_2 in individuals >14 years of age (in the absence of complete right bundle-branch block) or in V_4, V_5, or V_6 Inverted T waves in leads V_1, V_2, V_3, and V_4 in individuals >14 years of age in the presence of complete right bundle-branch block

Repolarisation changes: TWI



- Seen in 32-50% of ARVC
  - Sensitivity 47%
  - Specificity 96%
- Seen in 1-3% of normal young patients
- Seen in 20-30% of RVOT VT



Heart Rhythm Congress

Electrical abnormalities

Table 2
Incidence of electrical abnormalities on ECG, SAECG, and 24-hour Holter monitor in several series of patients with ARVC/D

Publications	Nava et al [1]	Peters and Trummel [10]	Dalal et al [12]	Cox et al [13]	NIH registry data
No. of patients	136	265	69	42	95
1. Depolarization and conduction abnormalities					
(*a*) Epsilon waves	4%	23%	29%	10%	1%
(*b*) Localized QRS >110 ms in V_1, V_2, or V_3 (in absence of RBBB)		70%	58%	26%	24%
(*c*) QRS duration ratio $\frac{V_1+V_2+V_3}{V_4+V_5+V_6}$ >1.2		98%		35%	17%
(*d*) Prolonged S-wave duration			91%[a]	52%[a]	34%[b]
Terminal activation delay				71%[c]	
(2) Repolarization abnormalities					
Inverted T waves V_1					18%
V_1 and V_2					6%
$V_1 + V_2 + V_3$	19%	31%	81%[d]	67%	16%
Beyond V_3	18%	23%			31%
Only V_4, V_5, V_6					3%
(3) LBBB, VT on ECG Holter or exercise test					
(*a*) Sustained VT			77%	42%	35%
(*b*) 1000 PVCs/24 h on Holter			67%	28%	57%

[a] Prolonged S-wave duration from nadir of S wave to isoelectric line >55 milliseconds in leads V_1–V_2.
[b] From nadir of S wave to end of depolarization (R′).
[c] From nadir of S wave to end of all depolarization including an epsilon wave.
[d] T ↓ V_1 to V_3 or beyond.

Arrhythmias

Major Criteria	Minor Criteria
V. Arrhythmias	
Nonsustained or sustained ventricular tachycardia of left bundle-branch morphology with superior axis (negative or indeterminate QRS in leads II, III, and aVF and positive in lead aVL)	Nonsustained or sustained ventricular tachycardia of RV outflow configuration, left bundle-branch block morphology with inferior axis (positive QRS in leads II, III, and aVF and negative in lead aVL), or of unknown axis >500 ventricular extrasystoles per 24 h (Holter)

Arrhythmias

Diagnostic Criteria for Arrhythmogenic Right Ventricular Cardiomyopathy

Criterios diagnósticos para la miocardiopatía arritmogénica del ventrículo derecho

Giovanni Quarta and Perry M. Elliott*

Inherited Cardiac Diseases Unit, The Heart Hospital, University College London, London, United Kingdom

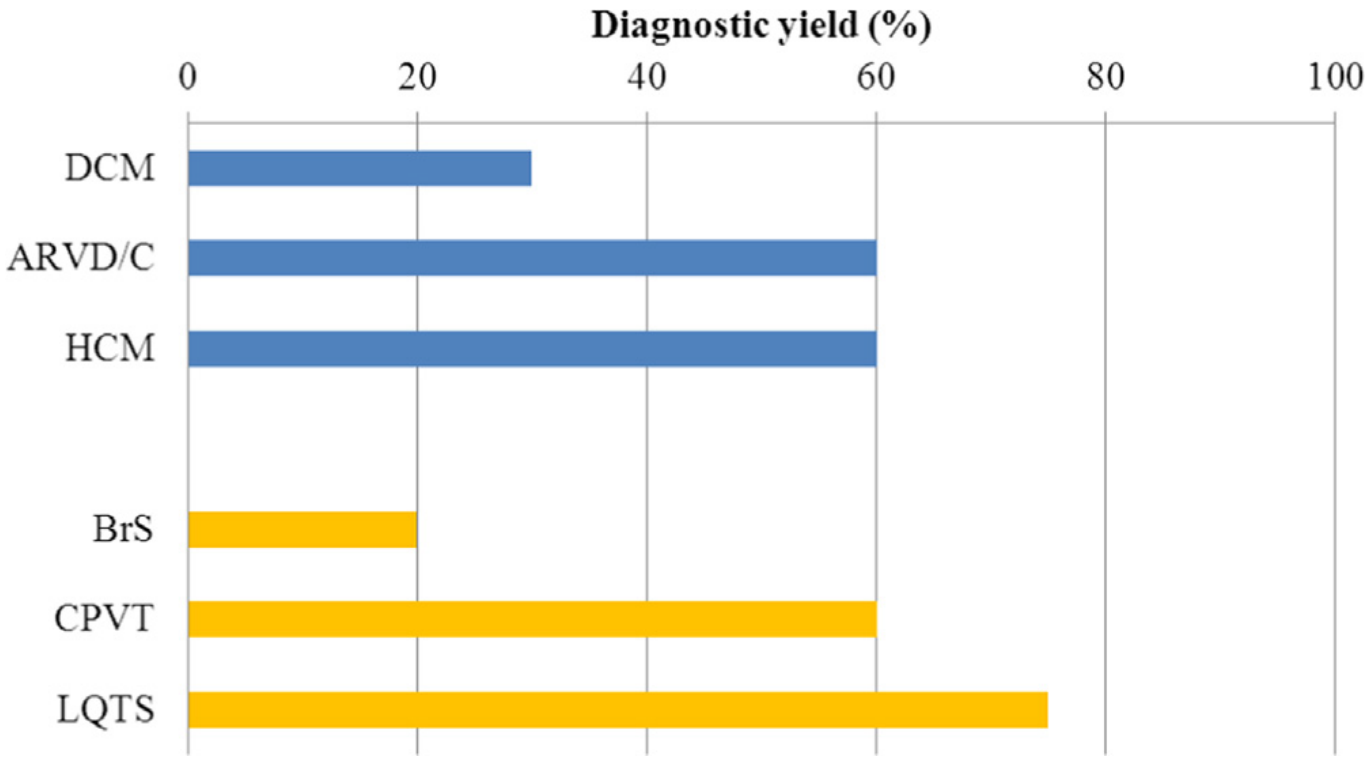
Rev Esp Cardiol. 2012;65(7):599–605

Family history

Major Criteria	Minor Criteria
VI. Family History	
ARVC confirmed in a first-degree relative who meets current TFC	History of ARVC in a first-degree relative in whom it is not possible or practical to determine whether the family member meets current TFC
ARVC confirmed pathologically at autopsy or surgery in a first-degree relative	Premature sudden death (<35 years of age) due to suspected ARVC in a first-degree relative
Identification of a pathogenic mutation categorized as associated or probably associated with ARVC in the patient under evaluation	ARVC confirmed pathologically or by current TFC in a second-degree relative

Genetics

- Inherited as Autosomal dominant trait in up to 50% of cases
- Incomplete penetrance
- Variable clinical expression



Family history & Progression

Yield of Serial Evaluation in At-Risk Family Members of Patients With ARVD/C

Tissue Diagnosis: Myocardial Bx

Major Criteria	Minor Criteria
II. Endomyocardial Biopsy	
Residual myocytes (60% by morphometric analysis or 50% if estimated), with fibrous replacement of the RV free wall myocardium in ≥1 sample, with or without fatty replacement of tissue on endomyocardial biopsy	Residual myocytes (60% to 75% by morphometric analysis or 50% to 65% if estimated), with fibrous replacement of the RV free wall myocardium in ≥1 sample, with or without fatty replacement of tissue on endomyocardial biopsy

Tissue diagnosis

Criterion	Sensitivity (%)	Specificity (%)
Major global/regional dysfunction of RV (echo, MRI, or angiography)	30	98
Minor/mild global or segmental dilatation or hypokinesis	58	76
RV wall thinning on MRI	58	79
Tissue characterization on Bx by the pathologist of "fibrofatty replacement"	62	91
Quantitative morphometric analysis on Bx of >18% fibrosis	56	71
T inversion in right precordial ECG	66	64
Epsilon waves or QRS prolongation	39	100
Any SAECG parameter beyond 2 Z-values	66	65
Any SAECG parameter beyond 1.5 Z-values	78	64
Frequent PVCs	48	54

ROBERT M. HAMILTON, M.D.
From the Labatt Heart Centre, The Hospital for Sick Children and Research Institute, University of Toronto, Ontario, Canada

Useful modalities outside TFC

- Tpe assessment
- Isoproterenol challenge
- Exercise Stress Test
- EPS, Voltage maps for scar assessment

Repolarisation change: Tpe (Tpeak-Tend)

The ECG Data of ARVC and RVOT-VT Patients

Variable	ARVC (n = 25)	RVOT-VT (n = 13)	P Value
T_{peak}–T_{end} in V1 (ms)	137.1 ± 32.6	93.8 ± 16.9	<0.001
T_{peak}–T_{end} in V2 (ms)	133.2 ± 35.5	104.7 ± 16.9	0.01
T_{peak}–T_{end} in V3 (ms)	125.7 ± 31.5	99.1 ± 19.6	0.09
T_{peak}–T_{end} in V4 (ms)	121.9 ± 26.5	92.3 ± 19.7	0.001
T_{peak}–T_{end} in V5 (ms)	123.1 ± 26.5	99.5 ± 20.1	0.04
T_{peak}–T_{end} in V6 (ms)	126.9 ± 32.2	89 ± 11.3	<0.001
Epsilon wave	2 (8)	0	-
Precordial T-wave inversion (V1–3)	16 (64)	1 (7)	0.002
QT ms	433.8 ± 93.2	384.1 ± 45.0	0.079
QTc ms	438.5 ± 78.4	388.2 ± 63.6	0.087
R–R interval ms	884.9 ± 264.4	819.5 ± 247.2	0.46
QRS duration >110 ms in V1–3	16 (64)	0	-
TAD prolongation >55 ms	12 (48)	1 (7)	0.004
