What is non-invasive assessment of arrhythmia

1. Usual “stuff”
 - a) ECG
 - b) Holter
 - c) Event Recorder
 - d) Exercise treadmill test
2. Interesting ? Mechanistic
 - a) ILR and ICD traces
 - b) Tilt table data
 - c) Exercise
 - d) Pre-ablation methods of provocation
3. Modern/future developments
 1. AliveCor
 2. Cardioinsight ECG vest
 3. Risk stratification tools (restitution curves)

Patient:

Recorded: Thursday, 25/02/2016, 10:39

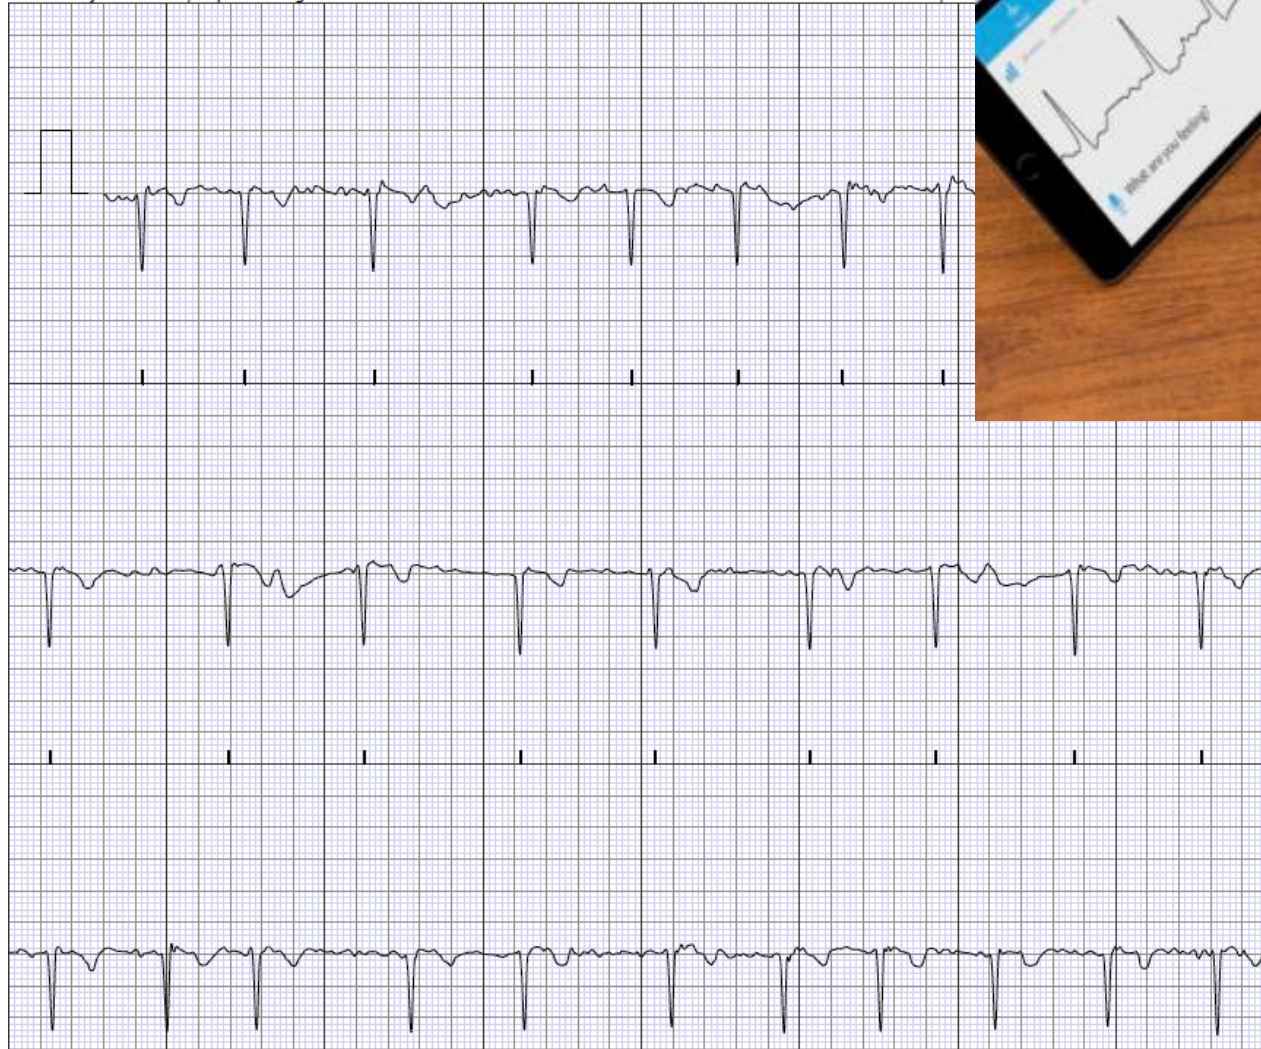

Heart Rate: 80 bpm

Duration: 30s

Finding by AliveCor: Possible atrial fibrillation

Recorded by: P Boon Lim, Imperial College Healthcare

Enhanced filter, Mail

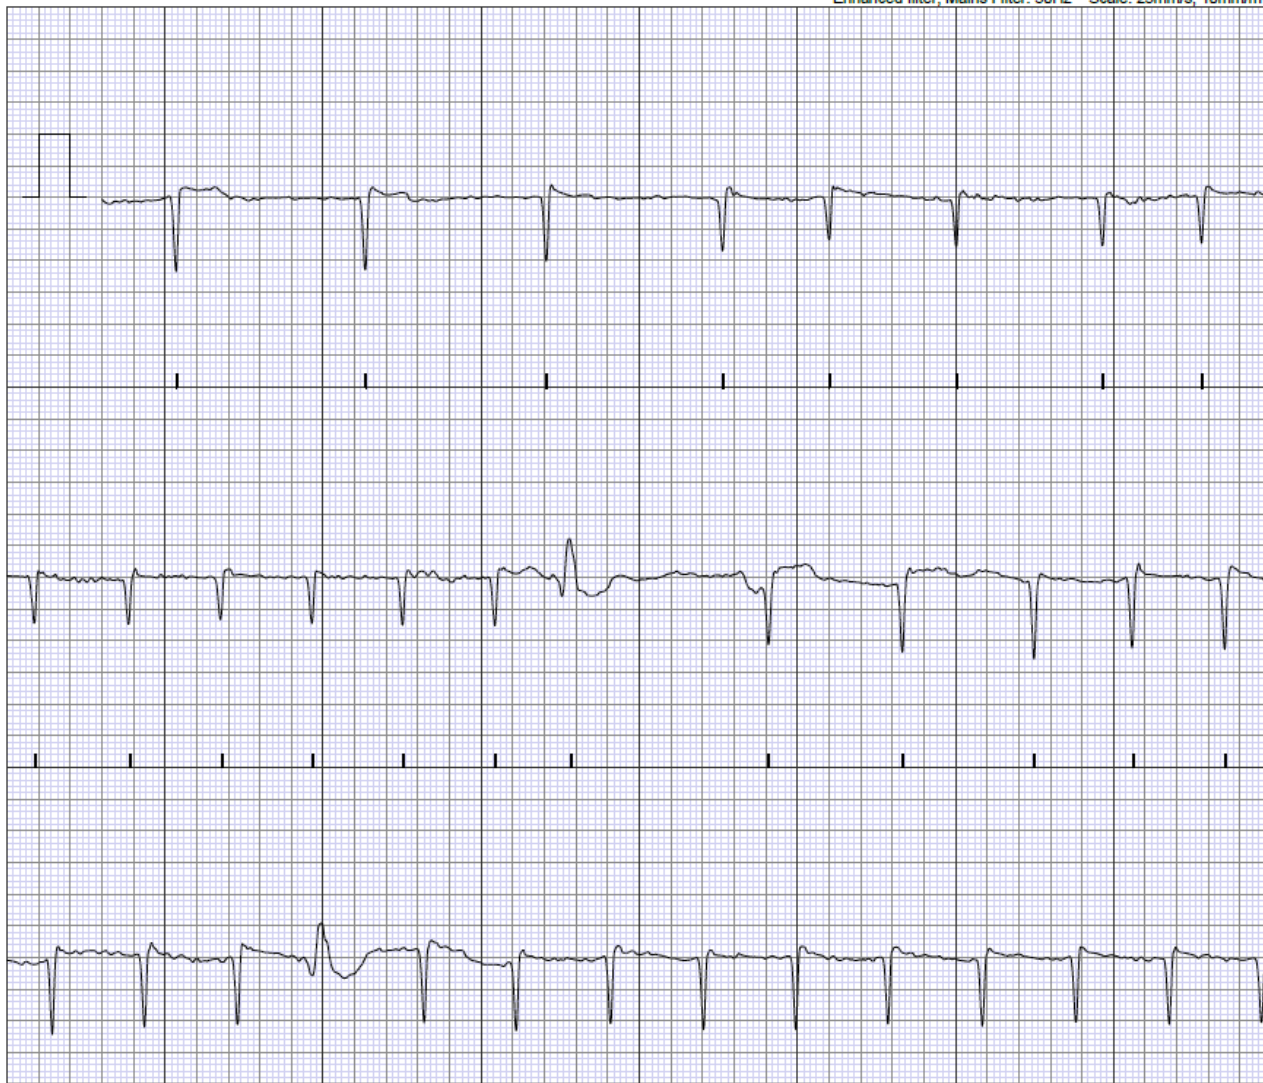

Recorded: Thursday, 15/09/2016, 12:23
Heart Rate: 101 bpm Duration: 25s

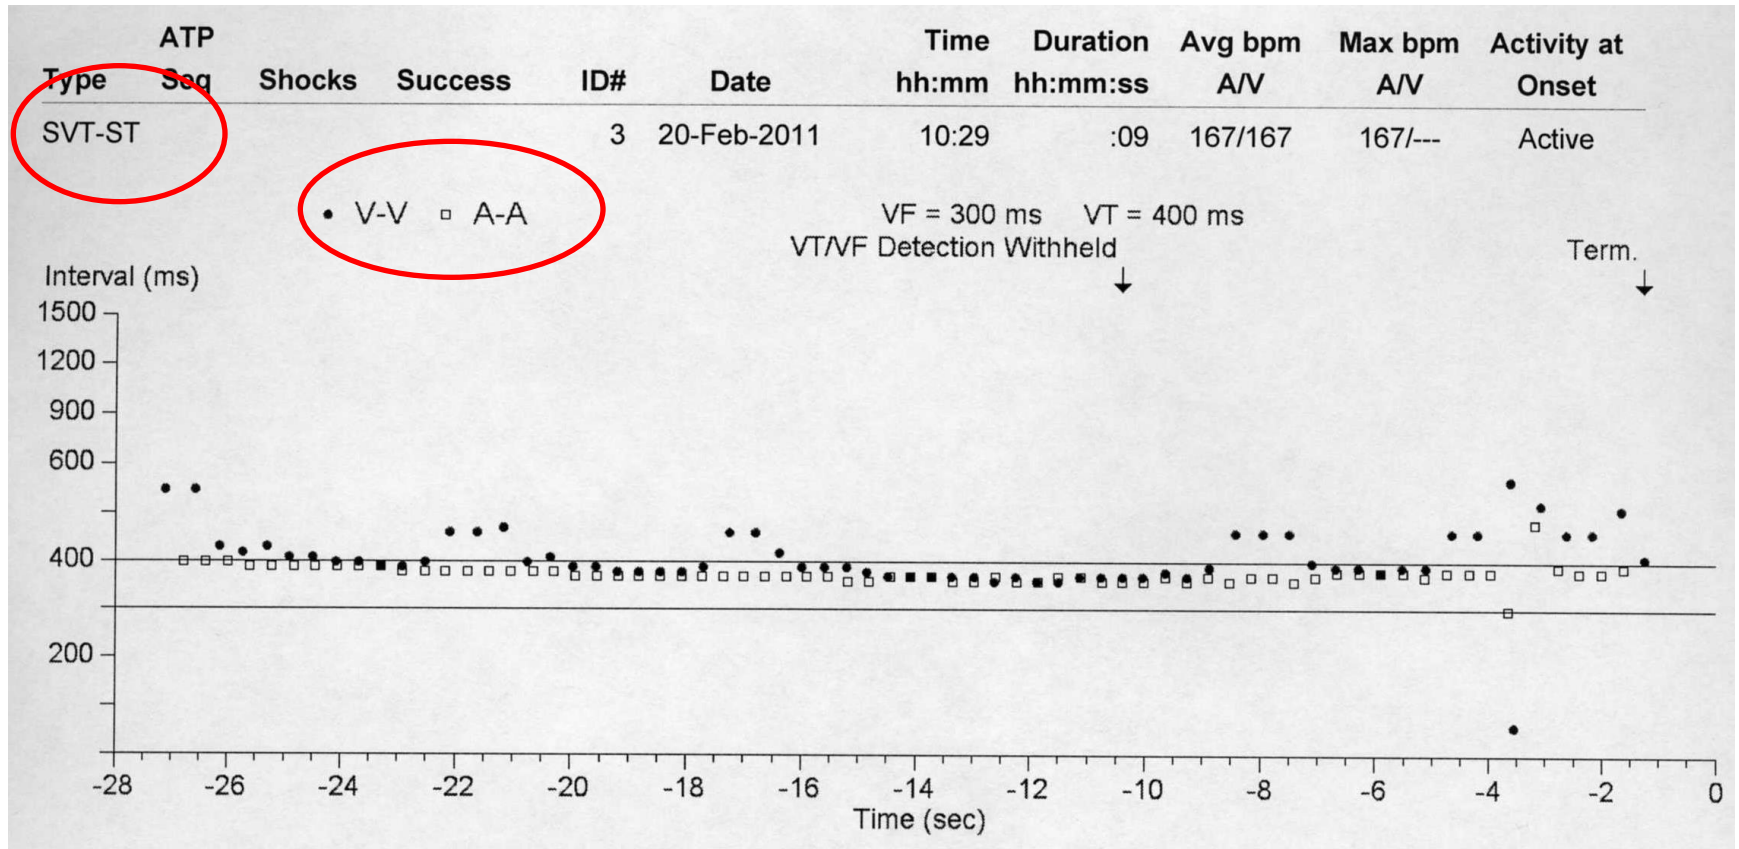

even when your heart rate goes up to fifty
reason still the techie cut it's just that it's

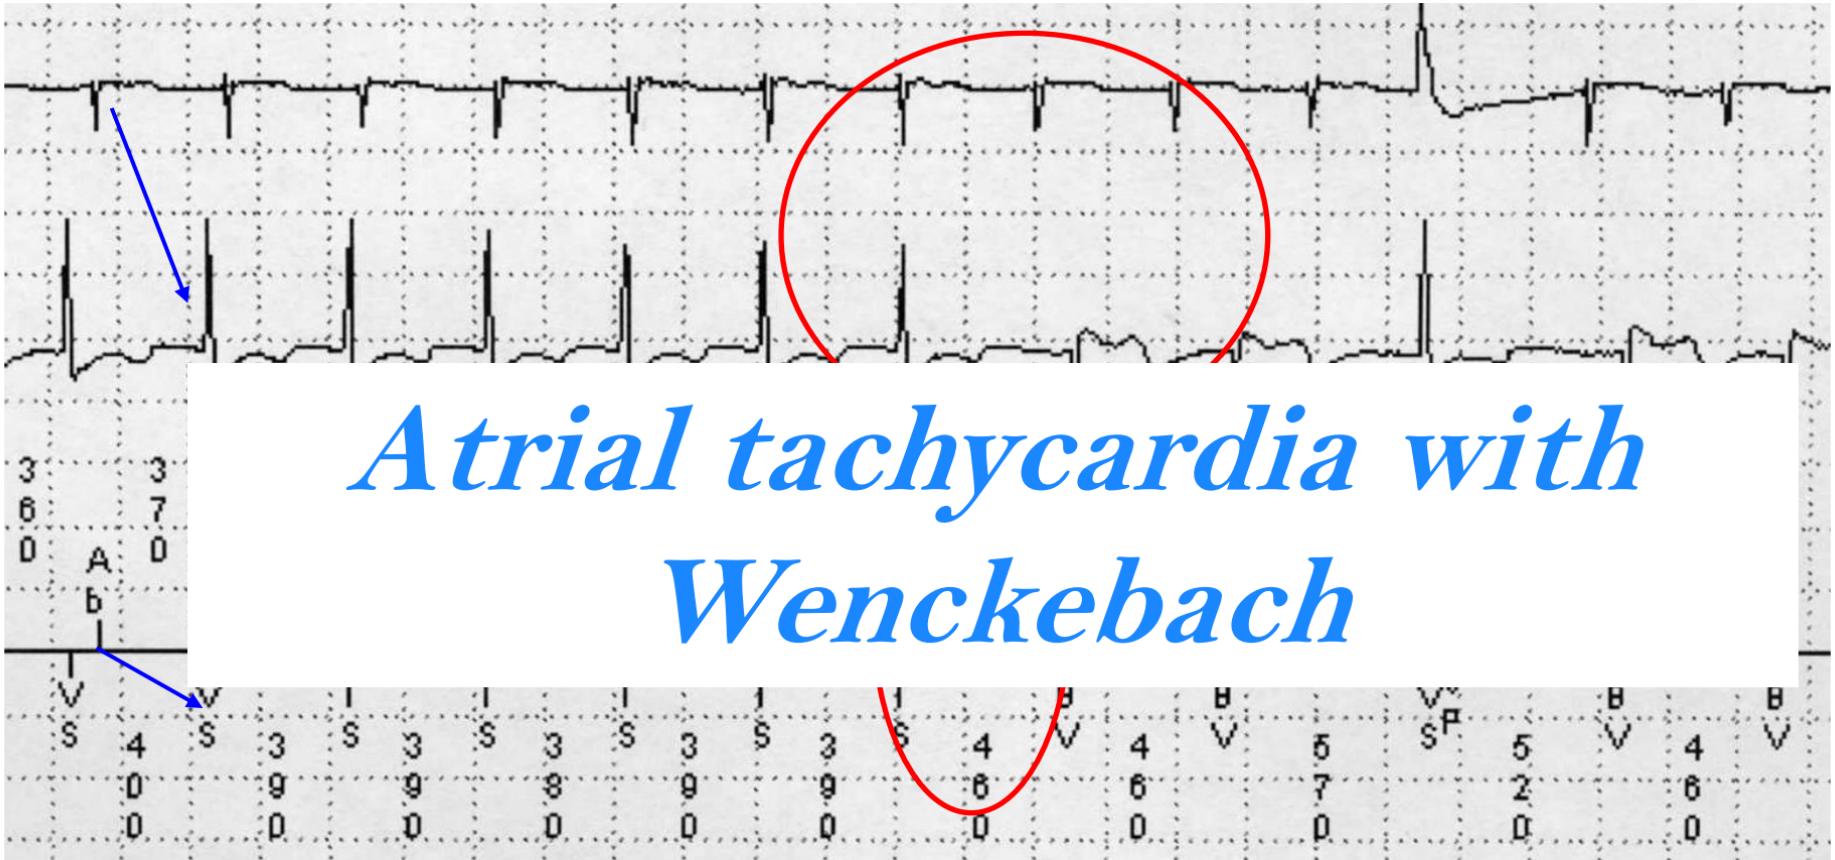

Finding by AliveCor: Short

Enhanced filter, Mains Filter: 50Hz Scale: 25mm/s, 10mm/mV

What the diagnosis?

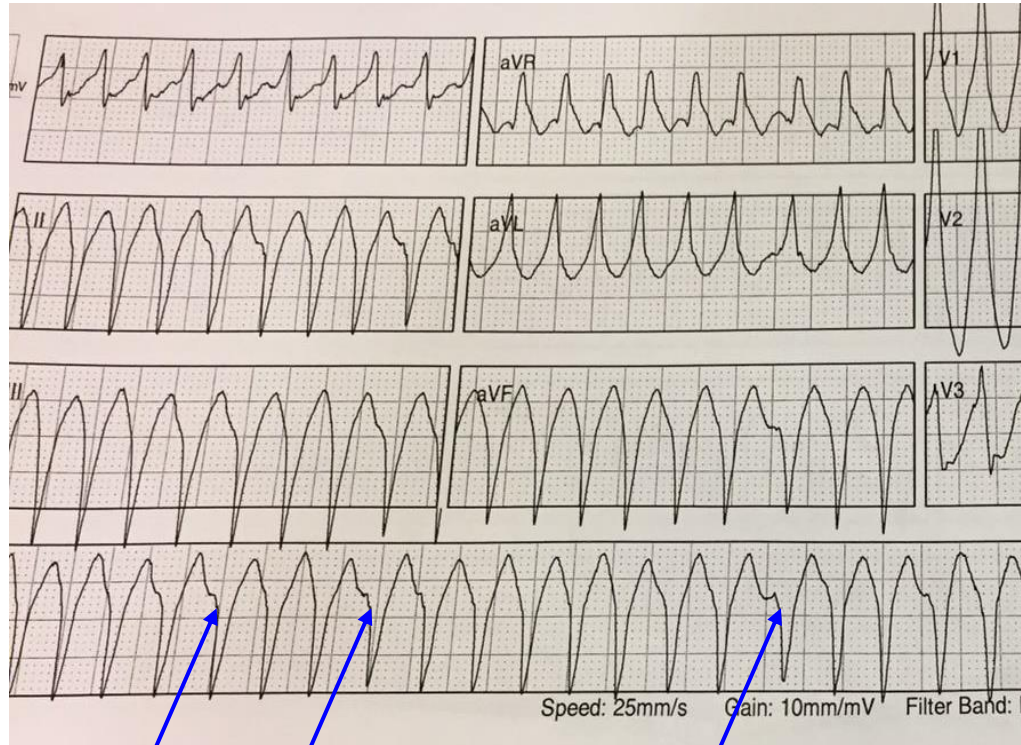

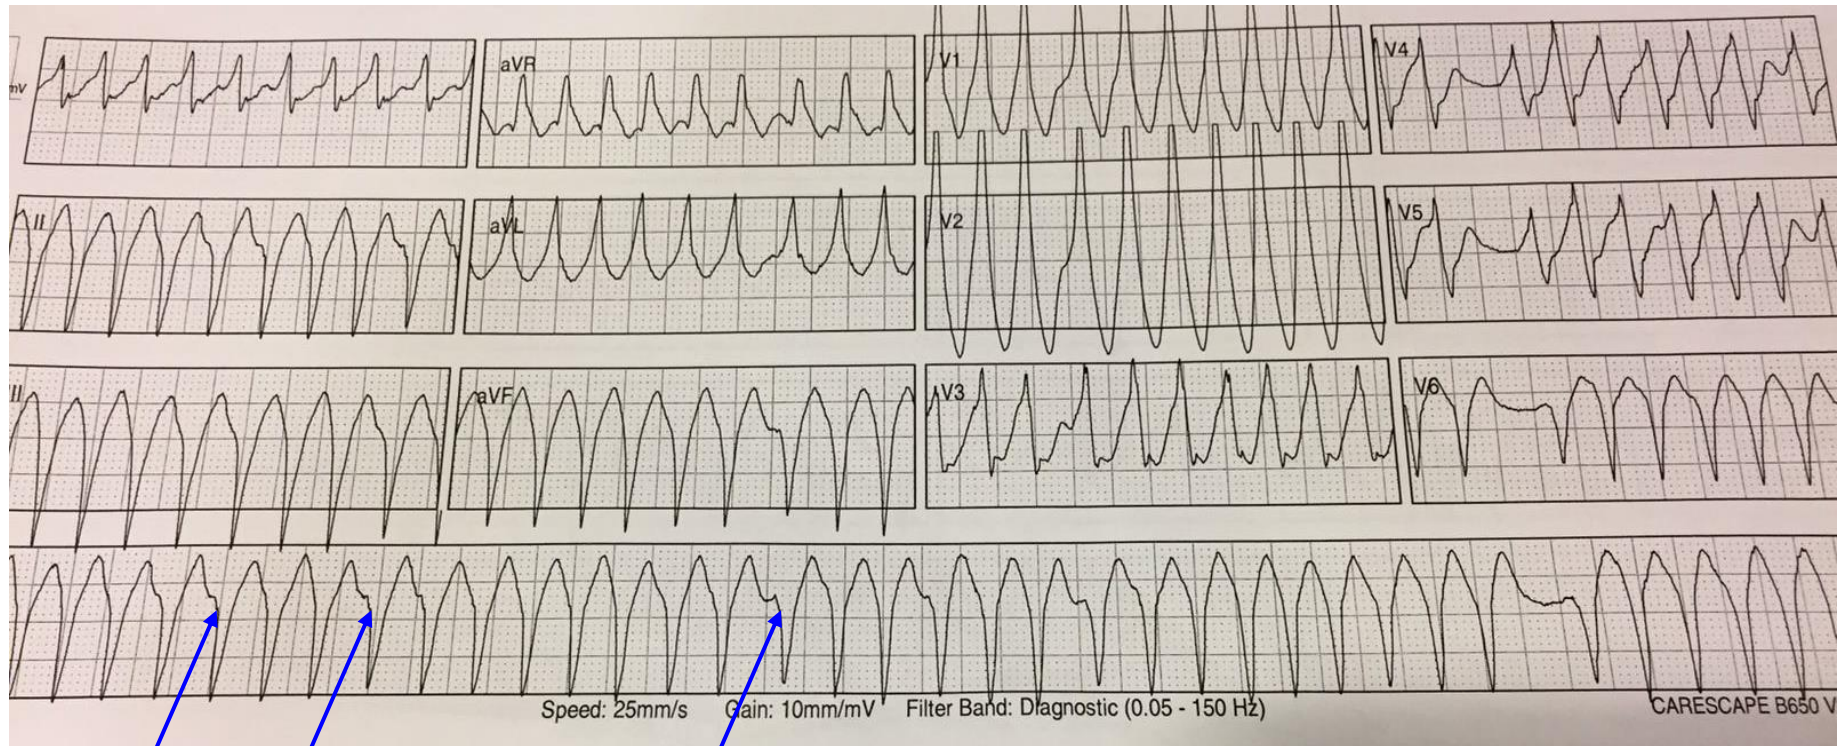

The image displays a 12-lead ECG tracing on a standard grid. The top half shows leads I, II, III, aVR, aVL, and aVF. The bottom half shows leads V1, V2, V3, V4, V5, and V6. A red circle highlights a sequence of four P waves in the upper leads, where the third P wave is dropped, illustrating the Wenckebach phenomenon. A blue arrow points to a P wave in lead II, and another blue arrow points to a P wave in lead V1. The text 'Atrial tachycardia with Wenckebach' is overlaid in blue italics.

Noninvasive electrocardiographic mapping to guide ablation of outflow tract ventricular arrhythmias

Shahnaz Jamil-Copley, MRCP,[†] Ryan Bokan, BSc,[‡] Pipin Kojodjojo, PhD, MRCP,[†] Norman Qureshi, MRCP,[†] Michael Koa-Wing, PhD, MRCP,[†] Sajad Hayat, MD, MRCP,[†] Andreas Kyriacou, MRCP,[†] Belinda Sandler, MRCP,[†] Afzal Sohaib, MRCP,[†] Ian Wright, BSc,^{*} David Wyn Davies, MD, FHRS,[†] Zachary Whinnett, PhD, MRCP,[†] Nicholas S. Peters, PhD, FHRS,[†] Prapa Kanagaratnam, PhD, MRCP,[†] Phang Boon Lim, PhD, MRCP[†]

From the ^{*}Department of Cardiac Electrophysiology, St. Mary's and Hammersmith Hospitals, Imperial College NHS Healthcare Trust, [†]Imperial College London, London, United Kingdom, and [‡]Cardioinsight Technologies, Cleveland, Ohio.

BACKGROUND Localizing the origin of outflow tract ventricular tachycardias (OTVT) is hindered by lack of accuracy of electrocardiographic (ECG) algorithms and infrequent spontaneous premature ventricular complexes (PVCs) during electrophysiological studies.

OBJECTIVES To prospectively assess the performance of non-invasive electrocardiographic mapping (ECM) in the pre-/periprocedural localization of OTVT origin to guide ablation and to compare the accuracy of ECM with that of published ECG algorithms.

METHODS Patients with symptomatic OTVT/PVCs undergoing clinically indicated ablation were recruited. The OTVT/PVC origin was mapped preprocedurally by using ECM, and 3 published ECG algorithms were applied to the 12-lead ECG by 3 blinded electrophysiologists. Ablation was guided by using ECM. The OTVT/PVC origin was defined as the site where ablation caused arrhythmia suppression. Acute success was defined as abolition of ectopy after ablation. Medium-term success was defined as the abolition of symptoms and reduction of PVC to less than 1000 per day documented on Holter monitoring within 6 months.

RESULTS In 24 patients (mean age 50 ± 18 years) recruited ECM successfully identified OTVT/PVC origin in 23/24 (96%) (right ventricular outflow tract, 18; left ventricular outflow tract, 6), sublocalizing correctly in 100% of this cohort. Acute ablation

success was achieved in 100% of the cases with medium-term success in 22 of 24 patients. PVC burden reduced from $21,837 \pm 23,241$ to 1143 ± 4039 ($P < .0001$). ECG algorithms identified the correct chamber of origin in 50%–88% of the patients and sublocalized within the right ventricular outflow tract (septum vs free-wall) in 37%–58%.

CONCLUSIONS ECM can accurately identify OTVT/PVC origin in the left and the right ventricle pre- and periprocedurally to guide catheter ablation with an accuracy superior to that of published ECG algorithms.

KEYWORDS Ventricular tachycardia; Premature ventricular complex; Outflow tract tachycardia

ABBREVIATIONS CT = computed tomographic; EF = ejection fraction; ECG = electrocardiographic; ECM = electrocardiographic mapping; EPS = electrophysiological study; LV = left ventricular/ventricle; LVOT = left ventricular outflow tract; OTVT = outflow tract ventricular tachycardia; PVC = premature ventricular complex; PVS = programmed ventricular stimulation; RV = right ventricular/ventricle; RVOT = right ventricular outflow tract; VT = ventricular tachycardia
